

Unlock your future

Scalable, enterprise-grade access control for health systems.

Hospitals are busy environments, with people coming and going at all hours. Network access control and intercoms help you balance ease of movement for staff, efficient patient and visitor management, and a secure environment for all. Our solutions are scalable, open, and enterprise-grade, so you can tailor them to your needs – from the front doors to the OR and beyond.

Customer needs

Smart and efficient access management

Enable seamless access for credentialed individuals and vehicles while preventing unauthorized access.

Facility oversight

Keep a record of people and vehicles on site.
Monitor and manage the status of each door.

Lockdowns

In the event of a critical safety or security event, immediately lock down the affected area.

Axis benefits

- > Reliable – works even when the network is temporarily down
- > Secure and hassle-free communication between door controllers and credential readers with Open Supervised Device Protocol (OSDP) verification
- > Multiple credential types, plus single- and multi-factor authentication
- > Scalable and easy to install, so it's easy to grow
- > Powerful, open, and flexible, so it's easy to integrate
- > A focus on cybersecurity
- > Compatible with enterprise-grade management software; some door controller models also come with Genetec Synergis software pre-loaded
- > Part of a broad portfolio of perfectly matched intercoms, cameras, audio, other IP-based devices, and management software

The right solution – everywhere

The security you need

Whether you need to secure one facility or several, monitor and manage it all from a single location. License plate recognition (LPR) solutions and credential readers automate access for pre-authorized individuals and keep a log of access attempts for post-incident investigations. Network video intercoms complete the solution by letting you see and speak to others requesting access. Using either Axis or the enterprise-grade management software of your choice, you can remotely monitor, open, and lock doors.

The credentials you want

Choose credential types depending on staff, patient, and visitor needs across your facility. Our solutions support LPR, access cards and key fobs, RFID, PIN codes – with an optional braille label accessory for touchpads – and mobile credentials, including Bluetooth and static and dynamic QR codes. Combine credentials for multi-factor authentication.

Seamless multi-factor authentication

Add an extra layer of security where you need it most – without slowing down authorized access. For example, because network devices can communicate with each other, a video intercom or camera equipped with AI-powered analytics can use facial recognition or the color of scrubs as an additional authentication factor.
